

The Water Journey

Where Morocco’s water begins — Atlas snowmelt, the Oum Er-Rbia, and the Al Massira reservoir

Morocco’s water starts high.

Winter snow and rain on the Middle Atlas — the pale peaks, rising above 3,000 m — drain down the Oum Er-Rbia and collect behind the Al Massira Dam. From this one reservoir, water travels northwest to Casablanca and the Doukkala farmland.

When the mountains get less snow, everything downstream feels it — and Al Massira has already lost about 91% of its water surface since 2017.
